

The installation of Enkadrain as multifunctional layer guarantees the construction of a super structure with an expansion-layer for the water vapour. The draining layer enables the derivation of the escaped water without back flow. The filtering non-woven serves as protection of the sealing and as filter barrier for the substratum. The great advantage of green roofs is the high retention capacity of precipitation water and the unloading of the collecting systems connected hereto.

In addition to the economical and ecological aspects, this factor was decisive for the projects "Youth Hostel Possenhofen" and "BTZ Landshut", Germany with a total green surface of approx. 10,000 sqm using Enkadrain.

These projects as well as a huge number of other examples prove the functionality and reliability of Enkadrain.
